

HOW DOES IT WORK?

The ENDOLIFT® treatment is always performed in a clinic setting.

Microscopic optical fibers, a bit thinner than a hair (FTF Eufoton), are easily inserted under the skin into the superficial hypodermis.

The procedure does not require incisions or general anesthesia and it is very well tolerated, with minimal down-time (it is possible to return to normal activities and to work within a few hours).

Results are not only immediate and long-term, but continue to improve during the 3 to 9 months following the procedure, as additional collagen builds in the deep layers of the skin.

As with all procedures in aesthetic medicine, the response and the duration of the effect depends on each individual patient and, if the physician deems it necessary, ENDOLIFT® can be repeated with no side effects.

The best non-surgical treatment to boost skin restructuring, reduce cutaneous laxity and excessive fat.

The aim of this leaflet is to provide general information on laser treatments. Please contact your doctor for further details concerning your case.

WHAT IS ENDOLIFT®?

ENDOLIFT® is a minimally invasive outpatient laser procedure used in endo-tissutal (interstitial) aesthetic medicine.

The treatment has multiple purposes: the remodeling of both deep and superficial layers of the skin, toning, the retraction of connective septums, the stimulation of collagen production and, when necessary, the reduction of excessive fat.

The main activity of ENDOLIFT® is promoting “skin tightening”, in other words the retraction and reduction of skin laxity thanks to the activation of neo-collagenesis and of metabolic functions in the extra cellular matrix.

The “skin tightening” created by ENDOLIFT® is strictly linked to the selectivity of the laser beam used, that is, to the specific interaction of the laser light which selectively hits two of the main targets of the human body: water and fat.

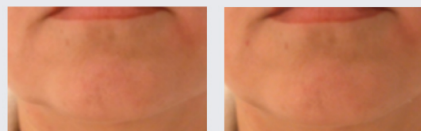

ADVANTAGES

- No general anaesthesia/no sedation
- Safe, visible and immediate results
- Long-term effect
- A single session
- No incisions/no stitches
- Outpatient treatment
- Quick recovery/minimal down-time
- Possibility of therapeutic combination with fractional non- ablative laser (LIGHTSCANTM 1500).

INDICATIONS

Face results

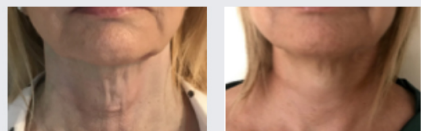

Mandibular Contour

Lower Eyelid

Neck

Chin

Body results

Periombelical Area

Gluteus

Knees

Inner Thigh

Ankles
